The invention set forth in claims 1 to 3 and 11 to 15 involves an inventive step in relation to the documents cited in the international search report. Documents 1 to 6 do not disclose a switching power supply circuit, provided with:

a first DC output voltage generating means, which is one of a plurality of DC output voltage generating means constituted in such a manner as to generate a plurality of DC output voltages by having the voltage obtained from the secondary winding of a converter transformer inputted and carrying out a rectification operation, and which is constituted in such a manner as to generate a first DC output voltage with a large supply power,

a second DC output voltage generating means which is another of the plurality of DC output voltage generating means, and which has a smaller supply power than the aforementioned first DC output voltage generating means,

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/JP 03/14457

a control transformer which has a shunt regulator that generates output of a level according to the second DC output voltage level, and is wound with control winding through which control current is allowed to flow according to the output of the shunt regulator and the controlled winding which is inserted in between the secondary winding and secondary DC output voltage generating means, and

a second constant-voltage control means constituted in such a manner as to perform constant-voltage control with respect to the second DC output voltage by varying the inductance of the winding being controlled according to the control current which flows to the control windings,

and said feature would not be obvious to a person skilled in the art.
